

IN THE CLAIMS:

The text of all pending claims (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. When strikethrough cannot easily be perceived, or when five or fewer characters are deleted, [[double brackets]] are used to show the deletion. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please AMEND claims 1, 5, 9, 13 and 17, CANCEL claims 3, 6, and 14 without prejudice or disclaimer, and ADD new claim 21 in accordance with the following:

1. (CURRENTLY AMENDED) A beam scanning apparatus, comprising a collimating lens in which a beam emitted from a light source is transformed into at least one of a convergent beam and a parallel beam with respect to an optical axis and outputted towards a slit, the collimating lens being one sheet of a spherical surface lens satisfying the relationship:

$$-0.3 < \frac{R2}{R1} < -0.1$$

$$0.05 < \frac{d}{f} < 0.5$$

in which, *R1* denotes a curvature radius of a first surface of the collimating lens opposing the light source and having a first positive constant refractive index, *R2* denotes a curvature radius of a second surface of the collimating lens opposing the slit and having a second positive constant refractive index, *d* denotes a center thickness of the collimating lens, and *f* denotes a focal length from the collimating lens to the light source, wherein the collimating lens is glass, and wherein a magnification ratio in a main scanning direction and a magnification in a sub scanning direction are substantially the same.

2. (ORIGINAL) The beam scanning apparatus of claim 1, wherein the collimating lens has a positive refractive power.

3. (CANCELED)

4. (ORIGINAL) The beam scanning apparatus of claim 1, wherein the slit is formed in an elliptical shape having a larger diameter in a main scanning direction than in a sub-scanning direction.

5. (CURRENTLY AMENDED) A beam scanning apparatus comprising:

a collimating lens in which a beam emitted from a light source is transformed into at least one of a convergent beam and a parallel beam with respect to an optical axis and outputted towards a slit, the collimating lens being one sheet of a spherical surface lens which comprises:

a first surface, opposing the light source, having a first curvature radius and a first positive constant refractive index;

a second surface, opposing the slit, having a second curvature radius and a second positive constant refractive index; and

a center thickness, wherein a length of the second curvature radius is between -0.3 and -0.1 times a length of the first curvature radius, and a length of the center thickness is between 0.05 and 0.5 times a focal length from the collimating lens to the light source wherein the collimating lens further comprises glass and preventing printing quality deterioration due to temperature change, and wherein a magnification ratio in a main scanning direction and a magnification in a sub scanning direction are substantially the same.

6. (CANCELLED)

7. (ORIGINAL) The beam scanning apparatus according to claim 5, wherein the collimating lens has a positive refractive power.

8. (ORIGINAL) The beam scanning apparatus according to claim 5, wherein the slit is elliptical and has a larger diameter in a main scanning direction than in a sub-scanning direction.

9. (CURRENTLY AMENDED) A beam scanning apparatus comprising:

a collimating lens in which a beam emitted from a light source is transformed into at least one of a convergent beam and a parallel beam with respect to an optical axis and outputted towards a slit, the collimating lens being one sheet of a spherical surface lens which comprises:

a first surface, opposing a light source, having a first curvature radius and a first positive constant refractive index;

a second surface, opposing a slit, having a second curvature radius and a second positive constant refractive index;

a center thickness of the collimating lens; and

a focal length from the collimating lens to the light source, wherein the collimating lens is glass, and

wherein a magnification ratio in a main scanning direction and a magnification in a sub scanning direction are substantially the same.

10. (ORIGINAL) The beam scanning apparatus of claim 9, wherein a length of the second curvature radius is between -0.3 and -0.1 times a length of the first curvature radius, and the length of the center thickness is between $.05$ and $.5$ times the focal length.

11. (ORIGINAL) The beam scanning apparatus of claim 9, wherein the collimating lens has a positive refractive power.

12. (ORIGINAL) The beam scanning apparatus of claim 9, wherein the slit is elliptical, the ellipse having a larger diameter in a main scanning direction than in a sub-scanning direction.

13. (CURRENTLY AMENDED) A beam scanning apparatus for use with a laser printer ~~with resolution ranging from 300 dots per inch to 600 dots per inch~~, comprising:

a laser diode to emit light;

a collimating lens, being one sheet of a spherical surface lens, including a first surface, opposing a light source and having a first curvature radius and a first positive constant refractive index, a second surface, opposing a slit that has a larger diameter in a scanning direction than in a sub-scanning direction and having a second curvature radius and a second positive constant refractive index, a center thickness, and a focal length from the collimating lens to the light source, wherein a length of the second curvature radius is between -0.3 and -0.1 times a length of the first curvature radius, and a length of the center thickness is between 0.05 and 0.5 times the focal length;

a cylinder lens in which light beams, passing therethrough, are transformed into linear shapes;

a rotating polygon mirror to move the horizontal linear beams from the cylinder lens at a constant linear velocity;

an f-theta lens having a constant refractivity with respect to the optical axis; and

a photosensitive drum on which image data is formed,

wherein the collimating lens is glass, and

wherein a magnification ratio in a main scanning direction and a magnification in a sub scanning direction are substantially the same.

14. (CANCELLED)

15. (ORIGINAL) The beam scanning apparatus of claim 13, wherein the collimating

lens has a positive refractive power.

16. (ORIGINAL) The beam scanning apparatus of claim 13, wherein the slit is elliptical and has a larger diameter in a main scanning direction than in a sub-scanning direction:

17. (CURRENTLY AMENDED) A beam scanning apparatus for use with a laser printer with resolution ranging from 300 dots per inch to 600 dots per inch, comprising:

a laser diode to emit light;

a collimating lens, being one sheet of a spherical surface lens, including a first surface, opposing a light source and having a first curvature radius and a first positive constant refractive index, a second surface, opposing a slit that has a larger diameter in a scanning direction than in a sub-scanning direction and having a second curvature radius and a second positive constant refractive index, a center thickness of the collimating lens, and a focal length from the collimating lens to the light source, ~~wherein the collimating lens is glass~~;

a cylinder lens in which light beams, passing therethrough, are transformed into linear shapes;

a rotating polygon mirror to move the horizontal linear beams from the cylinder lens at a constant linear velocity;

an f-theta lens having a constant refractivity with respect to the optical axis; and

a photosensitive drum on which image data is formed, and

wherein a magnification ratio in a main scanning direction and a magnification in a sub scanning direction are substantially the same.

18. (ORIGINAL) The beam scanning apparatus of claim 17, wherein a length of the second curvature radius is between -0.3 and -0.1 times a length of the first curvature radius, and a length of the center thickness is between 0.05 and 0.5 times the focal length.

19. (ORIGINAL) The beam scanning apparatus of claim 17, wherein the collimating lens has a positive refractive power.

20. (ORIGINAL) The beam scanning apparatus of claim 17, wherein the slit is elliptical, the ellipse having a larger diameter in a main scanning direction than in a sub-scanning direction.

21. (NEW) The beam scanning apparatus of claim 17, wherein the collimating lens is glass.
